

Mylife

Multimedia technology to support independence for and participation by people with dementia

Mylife uses services available on the Internet, such as calendars, photo albums, music, and news, and presents them together on everyday devices through an easy-to-use display accessed via a touch screen.

Mylife aims to support independence for older people with reduced cognitive function by giving them access to simple and intuitive services, that are adapted to their individual needs and wishes.

The service offered by Mylife supports time-orientation, communication and recreational activities.

Mylife will be first available in English, German and Norwegian.
